          histologically-determined to be fully malignant prostate cancer cells. Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                  ä
                                                                                                                                                                                                                                                                                                                                                       Sequence 70, Application US/08454557C
Patent No. 5830670
GENERAL INFORMATION:
APPLICANT: de la Monte, Suzanne
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: Of Alzheimer's Disease
NUMBER OF SEQUENCES: 121
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox P.L.L.C.
STREET: 1100 New York Avenue, Suite 600
                                                                                                            15260 ATACCAGCACTTTGGGAGGCCGATGTGGGTGGATCACCTGAGGTCAGGAGTTTGAGACCA 15319

Patent No. 5948688
GENERAL INFORMATION:
APPLICANT: de la Monte, Suzanne
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: Allaheimer's Disease
NUMBER OF SEQUENCES: 121
CORRESPONDENCE ADDRESS:
ADDRESSES: Sterne, Kessler, Goldstein & Fox P.L.L.C.
STREET: 1100 New York Avenue, Suite 600
APPLICANT: de la Monte, Suzanne
PEPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: of Alzheimer's Disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      21598 ACCAAGCCCGGCTAATTTTTTTTTAGTAAAGACGGGGTTTCACCATGTTGGTCAGG 21657

Williamson, R. and Humphriss, S. Unequal crossing-over between two alu-repetitive DNA sequences in the low-density-lipoprotein-receptor gene. A possible mechanism for the defect in a patient with familial hypercholesterolaemia Eur. J. Blochem. 164 (1), 77-81 (1987)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   *Source: hypercholesterol aemia
See X05248 for corresponding normal gene sequence
In the defective LDL-receptor gene the deletion ocurred between two
allurepetitive sequences, that are in the same direction, the
deletion eliminates exons 13 and 14 and changes the reading frame
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /cell_type="blood leukocytes from a patient with familial"

Williamson, R. and Humphries, S.
Unequal crossing-over between two alu-repetitive DNA sequences in the low-density-lipoprotein-receptor gene. A possible mechanism for Eur. J. Blochem. 164 (1), 77-81 (1987)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             See X05250 for corresponding normal gene sequence. In the defective LDL-receptor gene the deletion courred between two alu-repetitive sequences, that are in the same direction, the deletion eliminates exons 13 and 14 and changes the reading frame of the resulting spliced mRNA.

Data kindly reviewed (07-DEC-1987) by HUMPHRIES S.

PS Claim	Claim 1; Page 1748; 2245pp; Japanese.
	A single-stranded DNA (or its complementary strand or the corresp.
	e-stranded DNA) which comprises one of the 7837 "GS" sequences
	given in T19001-T26837 and which is able to hybridise to part of
	genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
	nces were obtained from 3'-directed cDNA libraries prepared
	from various human tissues; synthesis of cDNA was initiated from the
CC 3/-end	d of mRNA by using poly(T) as the sole primer. Since the 3'-
	nslated sequence is unique to a particular mRNA species, almost
	he 3'-oriented cDNAs hybridise with specific mRNAs. Each librar
CC is cor	is constructed so as to reflect accurately the relative abundance of
	different mRNAs in the particular tissue from which it was derived.
CC The ap	The appearance frequency of a given GS in a cDNA library can be
	determined (esp. using primers and probes derived from the GS
	sequences) as a means of diagnosing abnormal cell function or for
CC recodu	nising different cell types.

PR Waising or phenotypic typing for disease

PR (Claim I) Page 219; 310pp; English.

PR (Claim I) Page 219; 310pp; English.

X10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in CC X10269-X12937 are human DNA fragments which contain biallelic polymorphic CC markers which have been isolated using the primers represented in CC X10269-X12937 are human DNA fragments which contain biallelic polymorphic CC markers which have been isolated using the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual for used in methods for determining polymorphic forms in an individual for used in methods for determining polymorphic forms in an individual for used in winch as agammaglobulinemia, diabetes insipidua, Lesch-Nyhan syndrome, cuscopies, paternity testing or for phenotypic typing for diseases used and of standing polymorphic cancer, diseases, hereditary syndrome, osteogenesis inperfecta, acute intermittent porphyria, and syndrome, osteogenesis inperfect, acute intermittent porphyria, anterimment of iseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longwilty, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and suceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic or corpublaxis of such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                15725 CTGTAATCCCAGCAC-TTTGGGAGGCCAAGGCAGGCGGATCACTTGAAGCCAGGAGTTCA 15783

Testing or phenotypic typing for disease

7 determining polymorphic forms for use in e.g. forensics, paternity

7 testing or phenotypic typing for disease

8 Claim 1. Page 219; 310pp; English.

8 X10269-X12937 are human DNA fragments which contain biallelic polymorphic

8 X10269-X12937 are human DNA fragments which contain biallelic polymorphic

8 X10269-X12937 are human DNA fragments which expresented in

8 X10269-X12937 are human DNA fragments which serves the polymorphic site is indicated by

8 X10269-X120268. The base occupying the polymorphic stre is indicated by

8 Control of the proposition of the polymorphic of the servent of the appropriate IUPAC-IUB ambiguity code. These fragments can be used in

8 Control of determining polymorphic forms in an individual for use in

8 Control of the proposition of the proposition of the seases

8 Such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome,

8 Control of the proposition of the proposition of the seases, familial

8 Spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary

8 Control of the proposition of the proposition of the nervous

8 Syndrome, osteogenesis imperfecta, acute intermittent porphyria,

8 Syndrome, osteogenesis imperfecta, acute intermittent porphyria,

8 Syndrome, osteogenesis imperfecta, acute intermittent porphyria,

8 Syndrome, infection by pathogenic microcorganisms, and characteristics such

8 System, infection by pathogenic microcorganisms, and characteristics such

8 System, infection by pathogenic microcorganisms, and characteristics such

8 System, infection by pathogenic microcorganisms, and characteristics acute

8 System, infection by pathogenic microcorganisms, and characteristics and characteristics and characteristics and characteristics and characteristics and characteristics and characteristics.
                                                                                                                                                       A single-stranded DNA (or its complementary strand or the corresp. A single-stranded DNA) which comprises one of the 7837 "GS" sequences double-stranded DNA) which comprises one of the 7837 "GS" sequences of given in T19001-T25837 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer, since the 3'-end of mRNA by using poly(T) as the sole primer, since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for sequence 100 BP; 28 A; 22 C; 25 G; 22 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              QY 15897 ATCACTTGAACCGGGGAGGCAGAGGTTGCAGTGAGCTGAGATTTCGCCACTACACTACAG 15956

Claim 1; Page 219; 310pp; English.

X10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in X09121-X10268. The base occupying the primers represented by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in X09121-X10268. The base occupying the polymorphic stie is indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabeters insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Adrich syndrome, Pabry's disease, hereditary spherocytosis, polycystic kidney disease, hereditary papernome, osteogenesis inperfected, acute intermittent porphyria, autolimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   determining polymorphic forms for use in e.g. forensics, paternity testing or phenotypic typing for disease Claim 1; Page 219; 310pp; English.

X10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers represented in X09121-X10268. The base occupying the polymorphic site is indicated by the appropriate IUPAC-IUB ambiguity corner These fragments can be used in methods for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insiphdus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary
                                                                                                                                                  Claim 1: Page 1720; 2245pp; Japanese.

Claim 1: Page 1720; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp.

double-stranded DNA) which comprises one of the 7837 "GS" sequences
given in T19001-T26837 and which is able to hybridise to part of
human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature)

sequences were obtained from 3--directed CDNA libraries prepared
from various human tissues; synthesis of CDNA was initiated from the
3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
intranslated sequence is unique to a particular mRNA species, almost
all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
is constructed so as to reflect accurately the relative abundance of
different mRNAs in the particular tissue from which it was derived.
The appearance frequency of a given GS in a cDNA library can be
determined (esp. using primers and probes derived from the GS
sequences) as a means of diagnosing abnormal cell function or for
recognising different cell types.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           anti-inflammatory, immuno-stimulatory or suppressing agents
Claim 30; Page 73; 110pp; English.

The sequence is that of an isolated polynuclectide which may
be of use in the production of therapeutic compositions for
treating or ameliorating a medical condition in a mammal. Such
compositions may be used for, e.g. research purposes as markers for
tissues, molecular weight markers for gels, primers or probes, for
nutrition as carbon, nitrogen or carbohydrate source. They can also be
used as a cytokine for cell proliferation and differentiation activity,
as immune stimulants or suppressors, e.g. for viral, bacterial or fungal
infections, for autoimmune diseases such as multiple sclerosis or
systemic lupus erythematosus, to regulate haematopolesis, for tissue
promote, as an activator or inhibitor, or as a chemotactic or
phemotical and apprendiction or inhibitory, or as a chemotactic or
                            syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics suc as longevity, appearance (e.g. baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos

                                                                                                                                                                                                                                                                                                                                                         Claim 1; Page 1944; 2245pp; Japanese.

A single-stranded DNA (or its complementary strand or the corresp.

A single-stranded DNA, which comprises one of the 787 "GS" sequences
coulde-stranded DNA, which comprises one of the 787 "GS" sequences
coulde-stranded DNA, which comprises one of the 787 "GS" sequences
could war in 119001-126837 and which is able to hybridise to part of
human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
contained of mRNA by using poly(T) as the sole primer. Since the 3'-
conformalisted sequence is unique to a particular mRNA species, almost
all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
constructed so as to reflect accurately the relative abundance of
constructed so as to reflect accurately the relative abundance of
configuration of a given GS in a cDNA library can be
configuration of diagnosing abnormal cell function or for
recognising different cell types.

Constructed as means of diagnosing abnormal cell function or for
coconising different cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   15897 ATCACTTGAACCGGGGAGGCAGGGTTGCAGTGAGATTTCGCCACTACACTACAG 15956

This sequence represents the 3' end of clone M97_2, which is a polynucleotide of the invention. This sequence was isolated from a human neural tissue (glioblastoma line TG98G) cDNA library. The polynucleotide, which encodes a secreted protein, can be used, e.g. as a tissue or molecular weight marker, in genetic fingerprinting, to raise anti-protein or anti-DNA antibodies and in interaction trap assays. The protein can be used to assay blological activity, raise antibodies for use in immunoassays, as marker, to identify inhibitors of its interactions and as a nutritional supplement. If may also have a very wide range of therapeutic and biological activities (no examples are given to support this), e.g. cytokine or modulator of cell proliferation and differentiation, immunostimulant or immunosuppressant, haematopoiesis regulator, bone, cartilage, tendon, ligament and/or nerve tissue growth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               20049 GATTGCTTAAGCCCAGGAATTTAAGGCTGCAGGGAGCCATGGGGGCCCATTGCACTCCA 20108
                                                                                                                                                                                                                                                                                A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in T19001-T26837 and which is able to phybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using polyff as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived.
                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps

be of use in the production of therapeutic compositions for treating or ameliorating a medical condition in a mammal. Such compositions may be used for, e.g. research purposes as markers for tissues, molecular weight markers for gels, primers or probes, for nutrition as carbon, nitrogen or carbohydrate source. They can also be used as a cytokine for cell proliferation and differentiation activity, as immune stimulants or suppressors, e.g. for viral, bacterial or fungal infections, for autoimmune diseases such as multiple sclerosis or systemic lupus erythematosus, to regulate haematopolesis, for tissue growth, as an activator or inhibitor, or as a chemotactic or chemokinetic, haemostatic and thrombocytic, receptor/ligand, anti-liflammatory or tumour inhibitor agents.

cc designated bk95_3 (see also V61479), that codes for a novel secreted human protein (see W79089). bk95_3 was isolated from a human adult retina cDNA library using methods which are selective cc for cDNAs encoding secreted proteins, or was identified as encoding a secreted or transmembrane protein on the basis of computer analysis of the encoding protein. The bk95_3 sequence cc computer analysis of the encoding protein. The bk95_3 sequence shows homology to some database sequences and may include an Alureptitive element. The invention provides cDNA clones (see V61477-87) from human foetal kidney, adult testis, and adult or cc foetal brain cDNA libraries that code for secreted proteins (see W79087-97). These clones are deposited as ATCC 98364. The polynucleotides and proteins are predicted to have useful biological activities which would make them suitable for treating, cc preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional, immune stimulating (e.g. as cc vaccines) or suppressing, haematcopicisis regulating, tissue growth, ctc invasion suppressor and tumour inhibition activities. The cc invasion suppressor and tumour inhibition activities. The cc numour inhibition activities. The conditions are also stated to be useful for gene therapy.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SUMMARIES

                                                                                                                                                                                                                                                                 /note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not 1; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHil9W, testis NHT, and B-cell NCI_CGAP_GCBI) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302097, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo.

/note="vector: pAMP10; Site_1: Not1; Site_2: EcoRI; 1st
strand cDNA was primed with oligo(dT)17 on 50 ng of
bNAse-treated, total callular RNA obtained from
5,000-10,000 microdissected, histologically normal
prostate epithelial cells. Double-stranded cDNA was
ligated to EcoRI adaptors, 5 cycles of PCR applied to the
cDNA with an adaptor-specific primer, and the resulting
PCR product subcloned into pAMP10 by the UDG-cloning
method (Life Technologies). Average insert size is 600
bp. NOTE: Not directionally cloned. This library was
constructed by David Krizman."

/note="Vector: pAMP10; cDNA was generated from cytoplasmic RNA using a mixture of random DNA hexamers and oligo(dT).
From this pool of cDNA, human chromosome 7-enriched cDNA was isolated by direct cDNA selection using chromosome 7 genomic DNA (cosmids). The resulting direct-selected cDNA was cloned into a plasmid vector using a non-directional uracil DNA glycosylase (UDC)-mediated cloning strategy."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Anote—"Vector: paMp10; Site_1: Not1; Site_2: ECORI; Ist strand cDNA was primed with oligo(dT)17 on 50 ng of DNAse-treated, total cellular RNA obtained from 5,000-10,000 microdissected, histologically normal prostate epithelial cells. Double-stranded cDNA was ligated to ECORI adaptors, 5 cycles of PCR applied to the CDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  QY 18747 ITITITITITITIGAGAIGGAGTCTIACTCTGTCGCTCAAGCTGGAGTGCCAGATCT 18806

Patent No. 594888
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Of Alzheimer's Disease
TITLE OF INVENTION: Of Alzheimer's Disease
NUMBER OF SEQUENCES: 121
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox P.L.L.C.
STREET: 1100 New York Avenue, Suite 600
CITY: Washington
STRATE: D.C.
APPLICANT: de la Monte, Suzanne
APPLICANT: Wands, Jack R.
TITLE OF INVENTION: Neural Thread Protein Gene Expression and Detection
TITLE OF INVENTION: Allaheimer's Disease
NUMBER OF SEQUENCES: 121
